

Charlotte N.:

I'm 77 years old and been retired for a number of years. I love being retired, and I love now feeling well. I thought my real symptoms started about three years ago. It started years ago. I had a sports car, and I couldn't use the clutch because of my left knee, and that was the beginning of my arthritis, and I didn't even realize it. It reoccurred again about three years ago where I could hardly walk, so I went for shots. The doctor said I was bone-on-bone on both knees, and recommended surgery, and I said no, and so I started doing some stem cell research some years ago, and then on Facebook, of course, I saw Regenerative Medicine Northwest and I decided to contact them. Whoever comes to this particular center is fortunate because they use the umbilical cord from donors from C-section, and that's very high count of the stem cells itself, which is wonderful, and I did not want to use any of my own stem cells because they're less effective.

Charlotte N.:

It didn't hurt at all, so it was a very easy process, better than having an immunization. I had an ivy as well in my arm. I could feel it in my chest almost immediately. I could even taste it in my mouth. I had been having digestive problems off and on for years. The very next day I was fine. My right knee was stiff. I couldn't bend it backward. Both of them are bone-on-bone, with a little space in between. That's what made me a candidate, and three days later, I could bend my right knee backward, and within six days, I could squat, and I squatted not on purpose, but just kind of on habit to pick up something, and instead of bending over by the waist, I bent my knees down, and it was an awesome feeling. I don't need my cane. I got rid of it after about 10 days, I'm back to my normal self. I feel really good overall. It's worth the money and it's not that much when you think about the quality of your life for the rest of your life.
